Project MarketPulse

A Multi-Market Expansion & Monetization Product Strategy

1 | Business context: The Expansion Blind Spot

Ai Palette is an AI-powered consumer insights platform that enables **brands to identify** emerging trends, generate product concepts, and validate ideas before launch. Its solutions are widely used by enterprise customers across CPG, food and beverage, beauty, and related sectors to drive faster, **data-informed decisions**.

As Ai Palette continues to scale, a critical challenge has emerged beyond product capability: how to expand across markets while maintaining strong commercial performance and operational efficiency.

Different markets present different realities: consumer behavior varies significantly across regions, trends are often local and context-specific, and enterprise customers have varying expectations around pricing, product depth, and support. Entering new markets without a formalized product framework risks disproportionately increasing operational complexity without maximizing revenue.

Ai Palette website link: <https://www.aipalette.com/>

2 | The Challenge: Architecting MarketPulse

You are engaged as a Product Strategy Taskforce. Your objective is to move Ai Palette away from a monolithic product offering and architect **MarketPulse** a comprehensive product and commercial strategy that balances revenue potential, product complexity, and operational feasibility across global markets.

This is a **Product Management & Commercial Strategy challenge**. You must design a structured framework that determines the precise level of

product localization required and how the platform should be packaged and priced to ensure sustainable scale.

3 | The Product Landscape & Market Constraints

You will not be provided with a neat, pre-aggregated dataset. Instead, participants must conduct secondary research and build conceptual frameworks based on real-world SaaS realities.

You must account for:

- **The Localization Matrix:** Determining which product features remain global and which must be localized (e.g., language, market-specific categories, regional enterprise workflows).
- **The Commercial Reality:** Balancing per-seat pricing, per-use-case models, and enterprise subscriptions against varying regional willingness to pay.
- **The Operational Overhead:** The friction of customer onboarding, support structures, and service delivery across different customer types.

4 | Your Mission: The Scope of Work

Skip the generic expansion advice. We need actionable product truths across two phases:

Phase 1:

Product Localization & Feature Tiering (Design the Scale):

Define how Ai Palette should adapt its product across geographies. You must explicitly determine what should remain standardized and what should be localized to prevent engineering bloat. Create a feature-tiering logic that addresses varying enterprise maturity levels in new regions.

Phase 2:

Monetization & Go-To-Market (Design the Business):

Design the commercial structure of Ai Palette's offering. Determine which pricing model best supports adoption, retention, and revenue growth across markets. Map this directly to a product-led or sales-led onboarding model that manages service delivery without excessive operational overhead.

5 | Deliverables

Your final submission must bridge business realities with executable product growth plans.

Deliverable A: Product Strategy Deck (Max 9 Slides):

A structured executive presentation defining your market entry sequencing, pricing and packaging strategy, and the trade-offs between standardization and localization.

Deliverable B: The Commercial Architecture:

A clear, logical framework (table or diagram) mapping product tiers, localized features, and specific monetization approaches across your prioritized markets.

Project ValueForge

AI-Driven Product Value Proposition & Logic Strategy

1 | Business Context: The Differentiation Blind Spot

Ai Palette enables consumer brands to identify emerging trends and generate product ideas tailored to specific consumer personas. However, once product concepts are created, brands face a critical challenge: product claims across categories are increasingly homogenized.

As a result, despite strong trend alignment, many products fail to achieve high consumer recall, strong conversion rates, and sustainable brand positioning. This creates a "**Differentiation Blind Spot**", where insight exists, but distinct value creation is missing.

Ai Palette website link: <https://www.aipalette.com/>

2 | The Challenge: Architecting ValueForge

You are engaged as a Product Management Taskforce. Your objective is to design **ValueForge** a new product intelligence feature/system within Ai Palette that transforms trend-driven product concepts into clearly differentiated value propositions and high-resonance consumer positioning. This is a **Product Design & Strategy challenge**. You are expected to move beyond descriptive interpretation and architect a system workflow that interprets consumer intent, identifies competitive whitespace, and guides product-level decision-making.

3 | The System Architecture & User Context

You must design the logic, user journey, and product features of the ValueForge system.

Your design must account for how the platform will theoretically process:

- **Persona Intelligence:** How the tool utilizes demographic and psychographic attributes.
- **The Competitive Landscape:** How the tool maps existing products, overused claims, and pricing tiers to find gaps.
- **Consumer Response Logic:** How the system simulates or predicts user engagement with specific messaging or product formats.

4 | Your Mission: The Scope of Work

We need a clear product vision and logical system design across two phases:

Phase 1:

The Logic Engine (Find the Whitespace):

Design the conceptual framework ValueForge uses to evaluate competitive saturation. Define the rules and logic the system uses to identify under-served consumer needs and recommend tangible product features (ingredients, packaging, format).

Phase 2:

Product Experience & Output (Design the Tool):

Design the User Experience (UX) for a brand manager using ValueForge. How does the user input their baseline idea? How does the system display the recommended value propositions, risk of misalignment, and final messaging direction?

5 | Deliverables

Your final submission must function as a decision-support product design, bridging strategic logic with a clear user interface.

Deliverable A: Product Strategy Deck (Max 9 Slides):

A structured presentation that outlines the core problem ValueForge solves, the target user, and the logical framework used to identify differentiation and map consumer resonance.

Deliverable B: Product Requirements / Wireframe:

A visual prototype, wireframe, or detailed user flow diagram showing how a brand manager interacts with ValueForge to generate a final, decision-ready product strategy.

Project PriceSense

A SQL-Driven Pricing Intelligence Framework

1 | Business Context: The Pricing Blind Spot

Ai Palette helps brands identify emerging trends and validate ideas, but once a product reaches the market, a critical decision remains largely under-optimized: pricing. A D2C nutrition brand is launching a new range of high-protein snacks targeting fitness, budget, and premium personas.

The brand faces interconnected challenges: higher prices reduce demand, lower prices erode margins, and price sensitivity varies vastly across segments and geographies. Currently relying on intuition and limited experimentation, brands risk underpricing high-potential products or overpricing and losing demand. This creates a massive **Pricing Blind Spot**.

Ai Palette website link: <https://www.aipalette.com/>

2 | The Challenge: Architecting PriceSense

You are engaged as a specialized Product Strategy Taskforce. Your objective is to move the brand away from guesswork and architect **PriceSense** a SQL-driven, consumer-aware pricing intelligence module. This is a **Business Operation challenge**. You must use raw transactional data to determine optimal price ranges, quantify segment sensitivity, and evaluate how trend-aligned products sustain higher pricing.

3 | The Data Architecture

You are provided with structured data that requires extensive transformation.

- **transactions.csv** (The Sales Log): Transaction-level sales data detailing purchases and price points.
- **product_metadata.csv** (The Trend Layer): Product categories and trend claims (e.g., high-protein, clean-label).
- **consumer_segments.csv** (The Persona Intelligence): Consumer data including persona definitions, trend affinities, geography, and consumption occasions.

Note:

The dataset does not directly provide price sensitivity, elasticity, or optimal pricing. You must construct these concepts from first principles using SQL. Unsupported assumptions will be considered invalid.

4 | Your Mission: The Scope of Work

We need pure mathematical truth and actionable pricing strategy across two phases:

Phase 1:

Build the Sensitivity Framework (Find the Thresholds):

Clean the dataset and build structured SQL queries to measure demand distribution across price ranges. You must identify the exact price thresholds where demand drops significantly and compare price sensitivity across fitness, budget, and premium users.

Phase 2:

The Contextual Optimization (Fix the Future):

Evaluate how product attributes influence pricing power to see if trends justify premium tolerance. Tell us exactly how pricing should vary across states, city tiers, and consumption occasions to maximize revenue versus volume.

5 | Deliverables

Your final submission must translate raw data into decisions that can be acted upon by the business.

Deliverable A: The Pricing Strategy Memo (Max 9 Slides):

A concise executive summary highlighting ideal launch prices, segment-specific strategies, region-based adjustments, and the trade-offs between revenue and volume.

Deliverable B: The Technical Codebase (SQL Scripts):

Comprehensive SQL queries performing your price bucketing, demand analysis, segmentation, and insight generation.

Project ROI Lens

Advanced Marketing Attribution & Budget Refinement Strategy

1 | Business Context: The Attribution Blind Spot

Nexus Consumer Brands, a leading FMCG conglomerate, recently concluded a large-scale digital marketing initiative. Over the last quarter, a budget of **₹100 Crore** was deployed across five major channels: Instagram, Google Search, Influencer Networks, YouTube, and E-commerce Marketplaces.

To drive product innovation, Nexus heavily utilizes **Ai Palette's** trend-forecasting platform, creating products tailored to specific consumer personas (e.g., Gen-Z Trendseekers, Budget Parents).

Currently, Nexus relies on legacy "Last-Click" attribution models. This simplistic approach fails to account for the stochastic nature of modern consumer journeys, ignoring the synergistic effects of multi-channel interactions. As a result, Nexus is struggling to quantify the true Return on Investment (ROI) of its campaigns, leading to suboptimal budget allocation and significant revenue-at-risk.

Ai Palette website link: <https://www.aipalette.com/>

2 | The Challenge: Architecting ROI Lens

You are engaged as a specialized Product Strategy Taskforce. Your objective is to move Nexus away from rudimentary metrics and architect **ROI Lens**, a proprietary intelligence system that synthesizes consumer behavioral data with granular campaign financials.

This is a **Business Intelligence challenge**. You must use predictive or adaptive techniques not merely to predict an outcome, but to audit

historical data, uncover hidden behavioral economics, and dictate future strategy.

3 | The Data Architecture

You are provided with a comprehensive, unaggregated dataset simulating a real-world data ecosystem.

- **touchpoints.csv** (The Journey Log): Tracks every consumer interaction (Impression, Click, Add-to-Cart, Purchase) across channels, mapped via precise timestamps.
- **user_profiles.csv** (The Persona Intelligence): Demographic and psychographic data directly linked to Ai Palette's consumer segments and trend affinities.
- **campaign_spend.csv** (The Financial Layer): The pricing models (CPC vs. CPM) and total budget allocations for every campaign launched.

Note:

The dataset contains real-world friction, including bot traffic, diminishing returns (ad fatigue), and non-linear conversion paths. Directly proportional relationship will yield mathematically flawed business advice.

4 | Your Mission: The Scope of Work

Skip the vanity metrics. We need brutal truth and actionable strategy across two phases:

Phase 1:

Build the Attribution Framework (Find the Truth)

Trash the "last-click" baseline. Refine the raw logs (find the bot traffic!), and build a multi-touch probabilistic framework (e.g., Markov Chains, Shapley Value). You must map the non-linear journeys and tell which channels are top-of-funnel "primers" and which are actually driving the final purchase for each of the 10 brands.

Phase 2:

The Portfolio Reallocation (Fix the Future)

We are authorizing a fresh ₹100 Crore for next quarter. Using the true CPA metrics from Phase 1, build a constrained refinement framework. Explain exactly how to allocate the ₹10 Crore budget for each of the 10 brands to maximize overall conversions, factoring in ad fatigue and diminishing returns.

5 | Deliverables

Your final submission must bridge the gap between complex business intelligence and actionable executive strategy.

Deliverable A: The Business Intelligence Strategy Memo (Max 9 Slides):

A formal executive briefing intended for the Chief Marketing Officer. Translate your model outputs into strategic business decisions: Which campaigns should be defunded? Which channels require frequency caps? What is the exact ₹10 Crore reallocation strategy?

Deliverable B:

The Technical Codebase (Jupyter Notebook / Python Scripts):

Comprehensive, well-documented code demonstrating your data pipeline, financial calculations (CPA/ROI), attribution framework, and refinement logic.
